

Development of a Friction Tester for research of tribological properties

```
<p> I am a specialist presenter...,  
so I must be all-powerful. </p>
```

Why it's Important?

<p> Friction and wear are the main enemies of machinery </p>

Purpose of Work?

<p> Create a device that allows you to study how materials wear through friction, in real time </p>

How does it Work?

What's New?

<p> Added the ability to observe changes in material structure directly during friction</p>

<p> Synchrotron radiation utilisation</p>

RESULTS

What did you Get?

(0_o)
 $\langle | \rangle$
 $\wedge$

Established:

- Sensor data acquisition board
- Control board for servo drive
- Analysis software
- Friction Tester

How does that **HELP?**

Application

- Optimisation of materials for industry
- Development of wear-resistant coatings

THANK YOU!
